Administer Governance and Compliance

© Copyright KodeKloud

These Learn modules are part of the AZ-104: Manage identities and governance in Azure (<https://docs.microsoft.com/learn/patterns/az-104-manage-identities-governance/>) path.

Learning Objectives

- A Configure Subscriptions and Azure Resource Manager resources
- B Configure Azure policies
- C Configure Azure Role-Based Access Control

Moved Lab 03a – Manage Azure resources with the Azure portal into this module. It covers resource locks.

Learning Objectives

A Configure Subscriptions and Azure Resource Manager resources

01

Managing subscriptions

04

Azure Resource Tags

02

Resource Groups and Limits

05

Azure Resource Locks

03

Understanding the hierarchy

06

Manage costs

Configure Azure Role-Based Access Control

01

Role Based Access Control

02

Azure RBAC vs Microsoft Entra ID Roles

Managing Subscriptions

Azure Subscriptions

Logical container that defines the billing boundary for usage

Resources deployed in Azure will be mapped to an Azure subscription

Subscriptions can also help in setting up environmental boundaries

Every subscription has a unique ID called the subscription ID

An account can have multiple subscriptions

Identities that are part of Microsoft Entra ID or an identity from any trusted Microsoft cloud service can sign up for subscription

Subscriptions are of different types based on the use case scenario

Subscription also acts as a scope for access management

Subscription Offer Types

Resource Groups and Limits

Create Resource Groups

- A single resource group can be the sole container for any given resource.
- Resource groups can hold a diverse array of services that are deployed in multiple geographic locations.
- It is not possible to change the name of a resource group or to nest them inside another resource group.
- It is allowed to transfer resources from one group to another using Azure Resource Mover.

Resources grouped
(Web + DB, VM, Storage) in one group

Manage Azure Resource Manager resource groups by using the Azure portal - <https://docs.microsoft.com/azure/azure-resource-manager/management/manage-resource-groups-portal>

There is an excellent Learn module, Use Azure resources, <https://learn.microsoft.com/training/modules/use-azure-resource-manager/>. This covers the Azure Resource Manager, resources, limits, locks, and groups.

Determine Service Limits and Quotas

The screenshot shows the Azure portal interface for managing service limits and quotas. At the top, it displays 'MSDN Fribish RTN | Usage + quotas'. Below this, there are navigation links for 'New Quota Request', 'Refresh', 'Download', and search filters for 'Provider : Compute', 'Region : All', and 'Usage : Show all'. A message bar at the top provides instructions for setting up alerts and managing quotas. The main table lists 6226 records in 2 groups, showing details like Quota name, Region, Subscription, Current Usage (with progress bars), and Adjustable status. The table includes sections for 'Usage at low level' (4 items) and 'No usage' (96 items). The 'Adjustable' column contains 'Yes' or 'No' with edit icons.

Quota name	Region	Subscription	Current Usage	Adjustable
Total Regional vCPUs	Central India	MSDN Fribish RTN	5% (1 of 20)	Yes
Standard BS Family vCPUs	Central India	MSDN Fribish RTN	5% (1 of 20)	Yes
Virtual Machines	Central India	MSDN Fribish RTN	0% (1 of 25,000)	No
StandardSSDStorageDisks	Central India	MSDN Fribish RTN	0% (1 of 50,000)	No
No usage (Showing 96 of 6222)				
Availability Sets	Australia Central	MSDN Fribish RTN	0% (0 of 2,500)	No
Total Regional vCPUs	Australia Central	MSDN Fribish RTN	0% (0 of 20)	Yes
Virtual Machines	Australia Central	MSDN Fribish RTN	0% (0 of 25,000)	No

Resources have a default limit – a subscription quota

Help track current usage and plan for future use

You can open a free support case to increase limits to published maximums

Azure subscription and service limits, quotas, and constraints - <https://docs.microsoft.com/azure/azure-resource-manager/management/azure-subscription-service-limits>

Understanding the Hierarchy

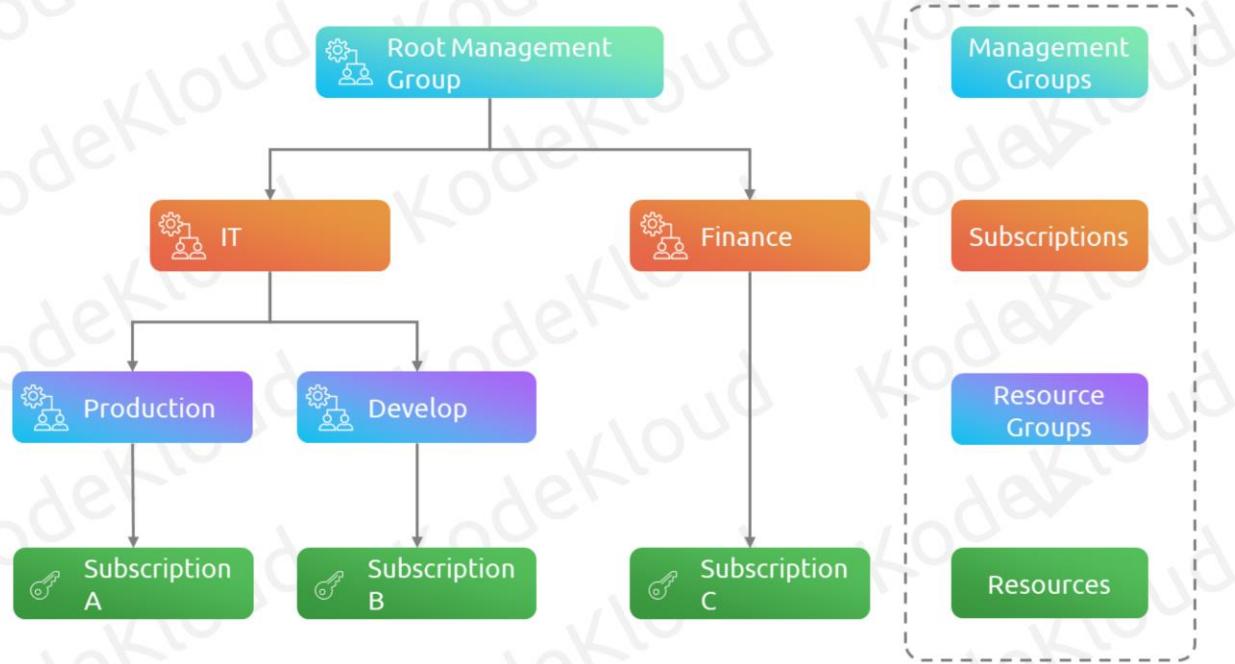

Understanding the Hierarchy

 Management groups offer a scope above subscriptions by which you will be able to group subscriptions together.

 Root Management group is created by default, and you have up to 6 levels of nested groups, excluding the root group.

 Each subscription will contain one or more resource groups for logically grouping resources like virtual machines, databases, etc.

 Hierarchy helps in implementing policies, access, and cost management.

Azure Resource Tags

Azure Resource Tags

Tags don't follow inheritance by default; we can use Azure Policy to inherit tags from resource group or subscription.

Resource Locks

Resource Locks

Avoid accidental changes

With the help of resource locks, we can protect our resources from accidental changes or deletion.

Inheritance

Locks can be applied at the subscription, resource group, and resource level. The lock will inherit to the lower scopes.

Read-only locks

Resources with read-only locks cannot be modified, and this will prevent any changes to the resource.

Delete locks

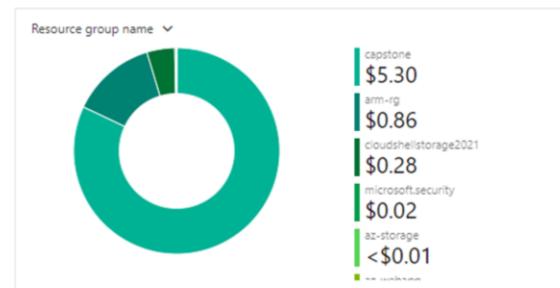

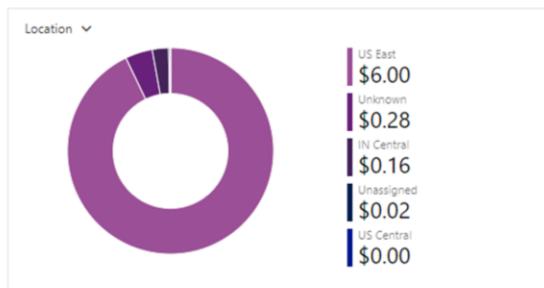

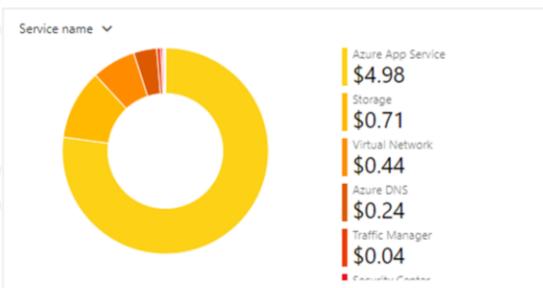

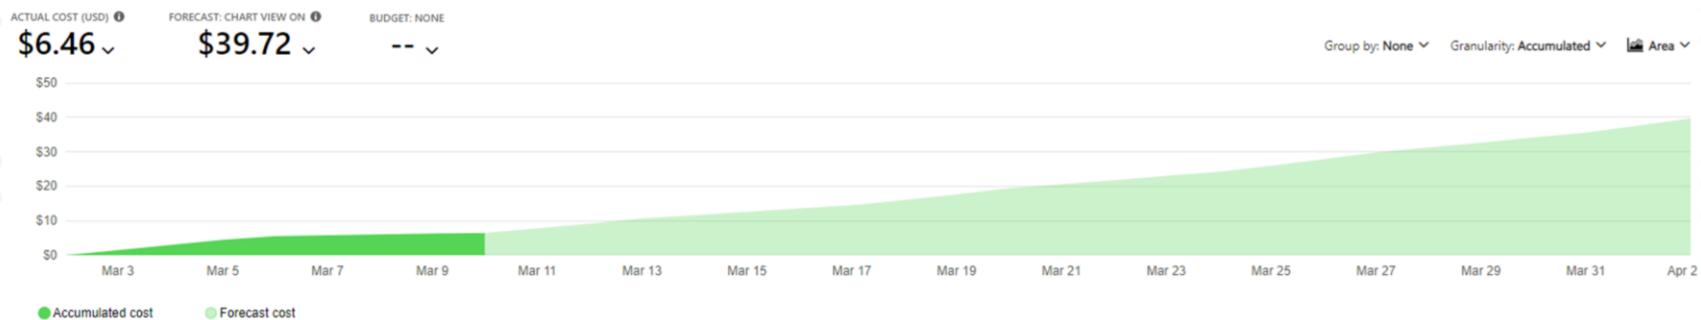

Resources with delete lock can be modified, but they cannot be deleted. Ideal for resources which you would like to modify and, at the same time, prevent accidental deletion.

Managing Costs

Analyzing Costs

Cost Analysis

Budgets and Recommendations

Export Data

Cost Saving

Azure Reserved Instances (RI)

For instances that are planned for the long term and are running 24x7 can be reserved. Reservations can be purchased for 1 year or 3 years with upfront payment or equated monthly payments.

Azure Hybrid Benefit (AHUB)

You can purchase Windows and SQL licenses from Software Assurance and can use them with your Azure VMs and PaaS services. AHUB is cheaper than PAYG licensing cost.

Credits

Credit-based subscriptions such as Visual Studio Enterprise, Visual Studio Professional, and MPN could provide you monthly credits that can be used for testing and developing solutions on Azure.

Regions

In Azure, every region has a different pricing. When deploying resources, choose low-cost regions. While selecting low-cost regions, do not compromise the compliance or performance of your workloads.

Configuring Azure Policy

Azure Policy

Helps us to create, manage, and assign policies. Policies can be used to define organizational standards and identify non-compliant resources.

Definition

Policy definition is a JSON document which is used to define the policy and its effect. Azure has built-in policies that we can use, or you can write your own custom policies.

Assignment

Assignment is the process of assigning a policy definition to a scope. Once it's assigned, policy enforcement is done.

Scope

Like RBAC, we must specify the scope to which we want to enforce the policy. We can scope to management group, subscription, or to resource group.

Compliance

After assigning the policy, we can evaluate the compliance to understand compliant and non-compliant resources.

Azure Policy – Use Cases

Allowed resource types

Define a set of resources that can be created in the selected scope

Allowed resource group locations

List of locations where you can create resource groups

Allowed virtual machine SKUs

Define a set of VM SKUs that can be deployed

Require tags

Enforce tags that need to be added to the resources

Inherit tags

Inherit tags from subscription or resource group

Allowed locations

Define a set of cloud locations where we can deploy resources

Configuring Initiatives

Initiative

Chaining policy definitions so that they can be assigned as a single item and compliance can be evaluated.

Not allowed

The terminal window shows the JSON structure of the 'Contributor' role. The title bar says 'Contributor'. The JSON object contains the following fields:

```
{  
  "Name": "Contributor",  
  "Id": "b24988ac-6180-42a0-ab88-20f7382dd24c",  
  "IsCustom": false,  
  "Description": "Grants full access to manage all resources, but does not allow you to assign roles in Azure RBAC, manage assignments in Azure Blueprints, or share image galleries.",  
  "Actions": [  
    "*"  
  ],  
  "NotActions": [  
    "Microsoft.Authorization/*/Delete",  
    "Microsoft.Authorization/*/Write",  
    "Microsoft.Authorization/elevateAccess/Action",  
    "Microsoft.Blueprint/blueprintAssignments/write",  
    "Microsoft.Blueprint/blueprintAssignments/delete",  
    "Microsoft.Compute/galleries/share/action"  
  ],  
  "DataActions": [  
  ],  
  "NotDataActions": [  
  ],  
  "AssignableScopes": [  
    "/"  
  ]  
}
```

Scope

Azure RBAC v/s Microsoft Entra ID Roles

Azure RBAC vs Microsoft Entra ID Roles

Azure RBAC

Microsoft Entra ID Roles

Used to manage access to Azure resources

Used to manage Microsoft Entra ID features

Scopes include Management groups, Subscriptions, Resource Groups, and Resources

Scope is at the Microsoft Entra ID tenant level

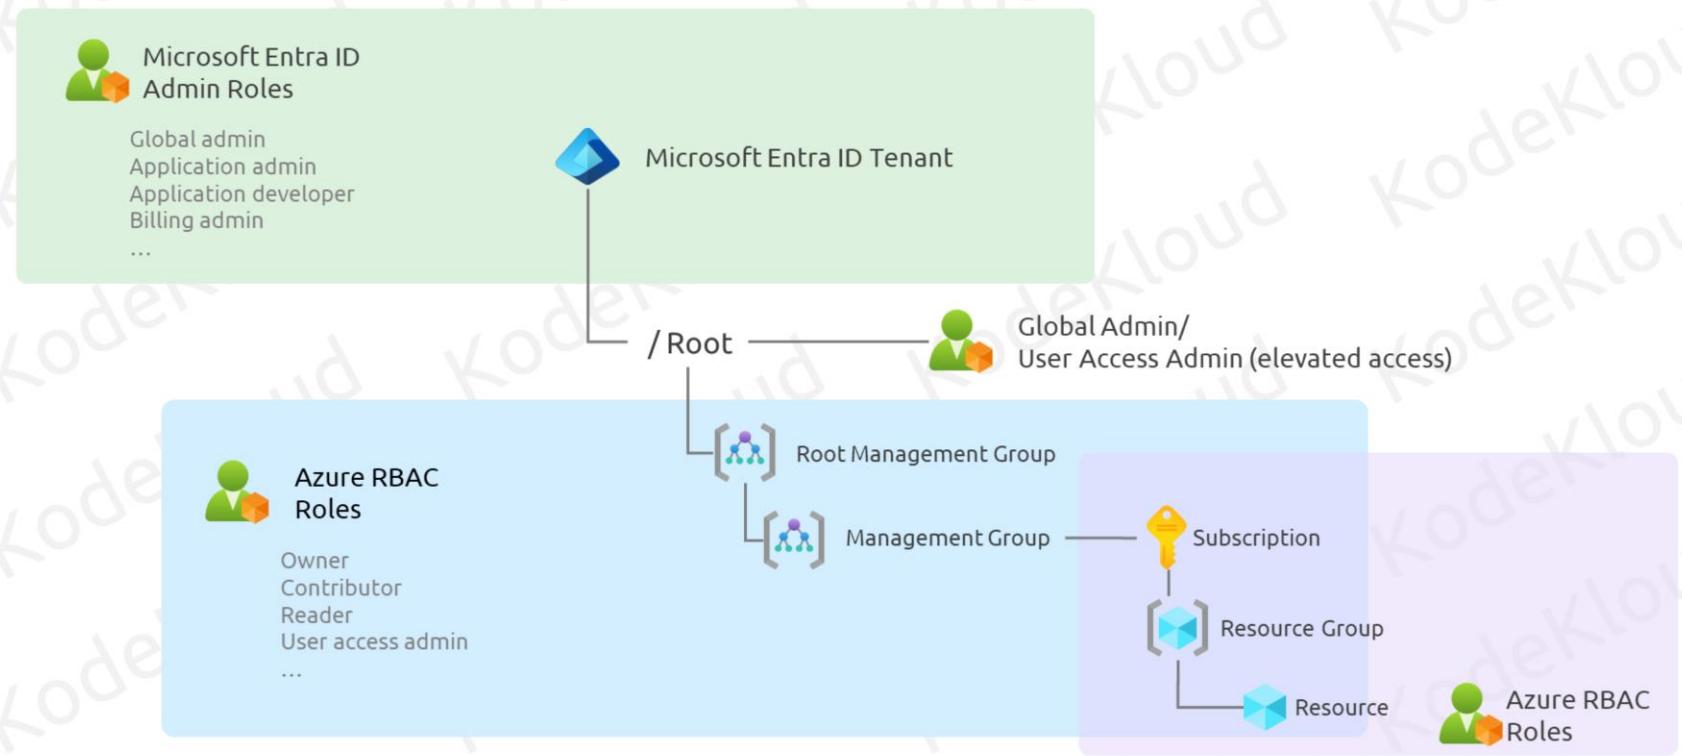

Role assignments can be managed via Azure Portal, Azure PowerShell, Azure CLI, ARM templates, and REST API

Roles can be managed via Azure Portal, M365 Admin Portal, Microsoft Graph API, Microsoft Entra ID, and Graph PS module

Example roles include Owner, Contributor, Reader, User Access Administrator, etc.

Example roles include Global Administrator, Billing Administrator, Global Reader, etc.
